

Reliability in harsh environment: Application in transportation and industrial environment

Eckard WOLFGANG (Germany) H  l  ne FREMONT(IMS-Bordeaux - France)

Example of harsh industrial environment: Hydrocarbon exploration

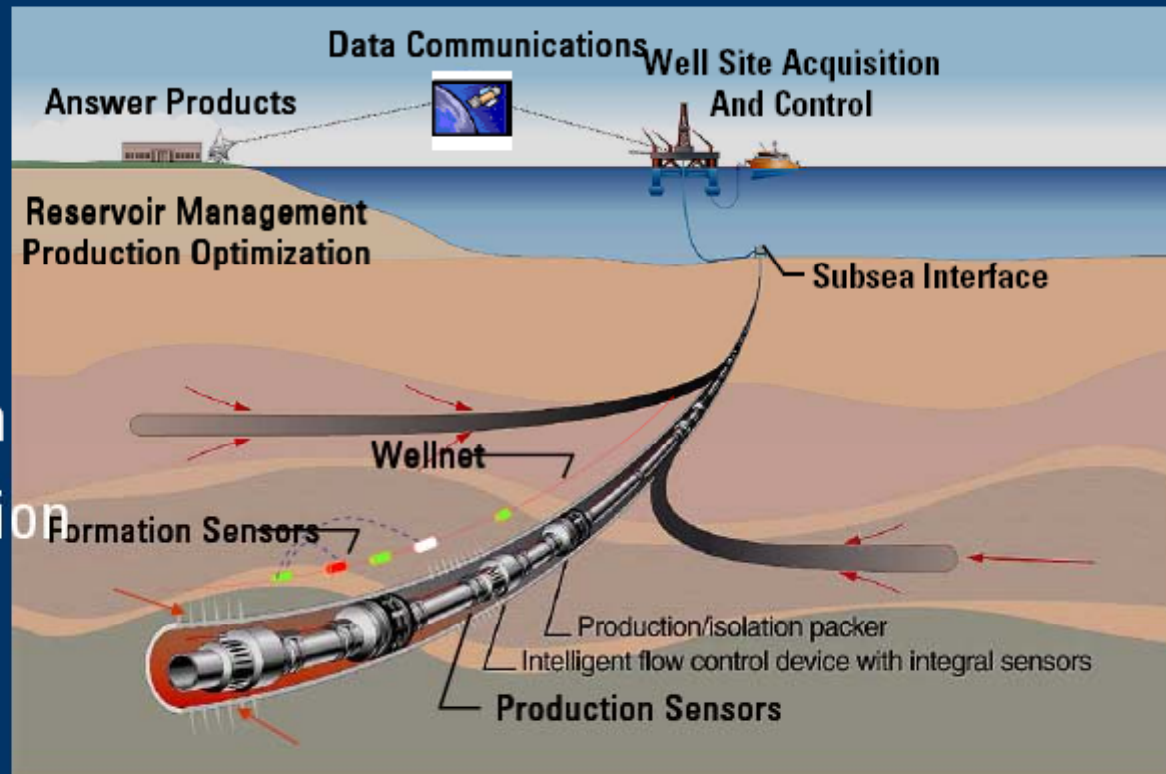

- Drilling is ever deeper:
 - Offshore exploration and production (E&P) is geared towards developments in depths greater than 1500 meters
 - Underground deeper than 10 km
- Harsher environments:
 - High temperatures: over 200°C, up to 300°C
 - High pressures: up to 2500 Bars
- Measurement while drilling (MWD) tools must survive high-pressure/high-temperature with real-time continuous inclination, vibration detection, annular pressure, and gamma ray detection

WCP-Reservoir Monitoring & Control

Manage Production, Optimize reserve recovery, Increase asset value

- Sensors
- Valves
- Telemetry
- Acquisition
- Interpretation

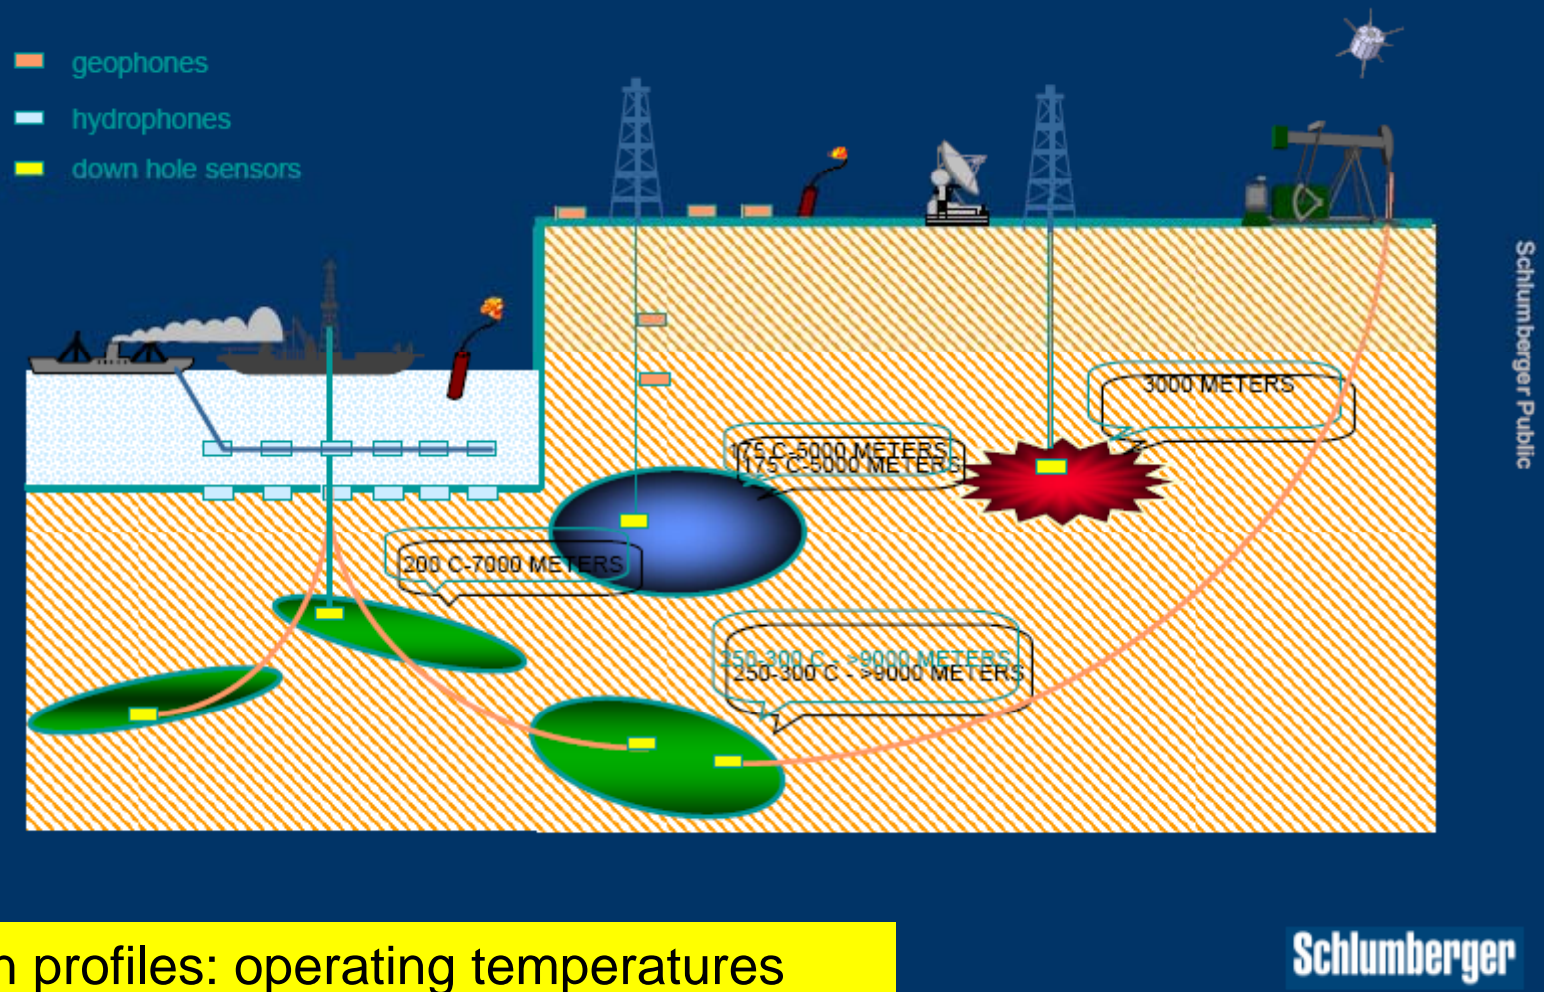

Schlumberger

*Reliability in harsh environment
Example : Hydrocarbon exploration*

Seismic Analysis

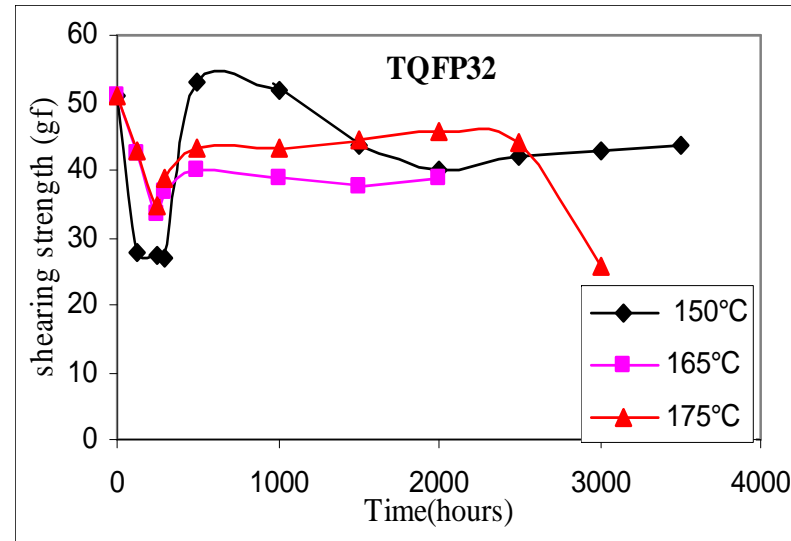

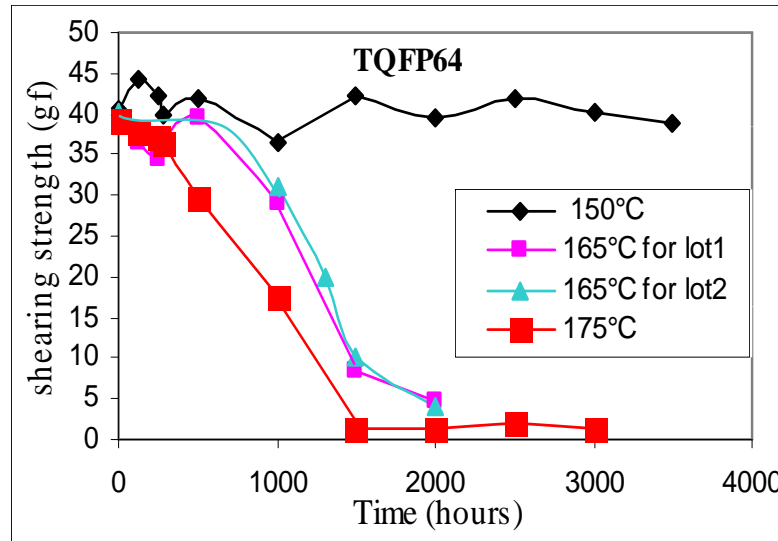

- Mission profiles: operating temperatures

- - 5000m : 175 °C
- - 7000m : 200°C
- - 9000 m : 300°C

Consequences on wire bonds

- Technological choice : Materials
 - Au on Al ?
 - Al on Au ?
 - Doped Al? Doped Au?
- Technological choice : Pad thickness ?
- Technological choice : Case size ?

Wire bonds in the automotive environment (M. Bahi)

Thermal storage aging conditions

Different temperatures: 150°C, 165°C and 175°C

Long durations: up to 3500h
